

# Operating the gas transmission system

We will start at 10.32 to allow people to finish previous meetings and join this session.

**nationalgrid**

**Slido.com**  
**#NGG4**

# Welcome and Opening

**Thank you for joining us today**  
**Please feedback via SLIDO**

**Slido.com**  
**#NGG4**

# Who will be speaking today?

**Glenn Bryn-Jacobsen**  
National Control  
Manager

**Craig Davies**  
Physical  
Operations  
Manager

**Jennifer Pemberton**  
Stakeholder  
Manager

# Logistics

Should last for approximately about 60 min

Questions via slido #NGG4

All callers will be placed on mute

We will circulate the slides and a recording of this webinar

# Agenda

**Part I :  
Operating the  
Gas National  
Transmission  
System 101**

**Part II :  
Impact of  
COVID-19 on UK  
Gas Demand**

# Part I : Operating the Gas National Transmission System 101

nationalgrid

# The National Transmission System (NTS) - An 'Active' Network

## Key Assets

- 7,660 km pipeline
- Operating pressure 38 - 94bar
- 23 compressor stations ( +1 St Fergus – Non NTS)
- Gas National Control Centre (GNCC) + Emergency Control Room + Data Centres
- 530+ Above Ground installations

## Entry Points

- 6 Beach Reception Terminals & 2 LNG Importation Terminals
- 3 Interconnectors
- 9 storage sites

## Exit Points

- Distribution Offtakes (121)
- Power Station (48)
- Large Industrial (21)
- Storage (10)
- Interconnectors (3)

National Grid

# What is real time role of the operator?

## Safe, Efficient and Economic operation of the National Transmission System

Pressure management (extremities, entry and exit points)	Managing System Balance	Selling Capacity & Managing System Constraints	Compressor optimisation	Gas quality	System access (maintenance and capital works)	Operating margins	Inform Customers of Issues	Emergency Arrangements	Forecast Supply & Demand	Faults & Defects
--	-------------------------	--	-------------------------	-------------	---	-------------------	----------------------------	------------------------	--------------------------	------------------

In achieving the above, the Gas System Operators primary tools in the short term are **optimising network assets, information provision** and **operational customer agreements** rather than market tools

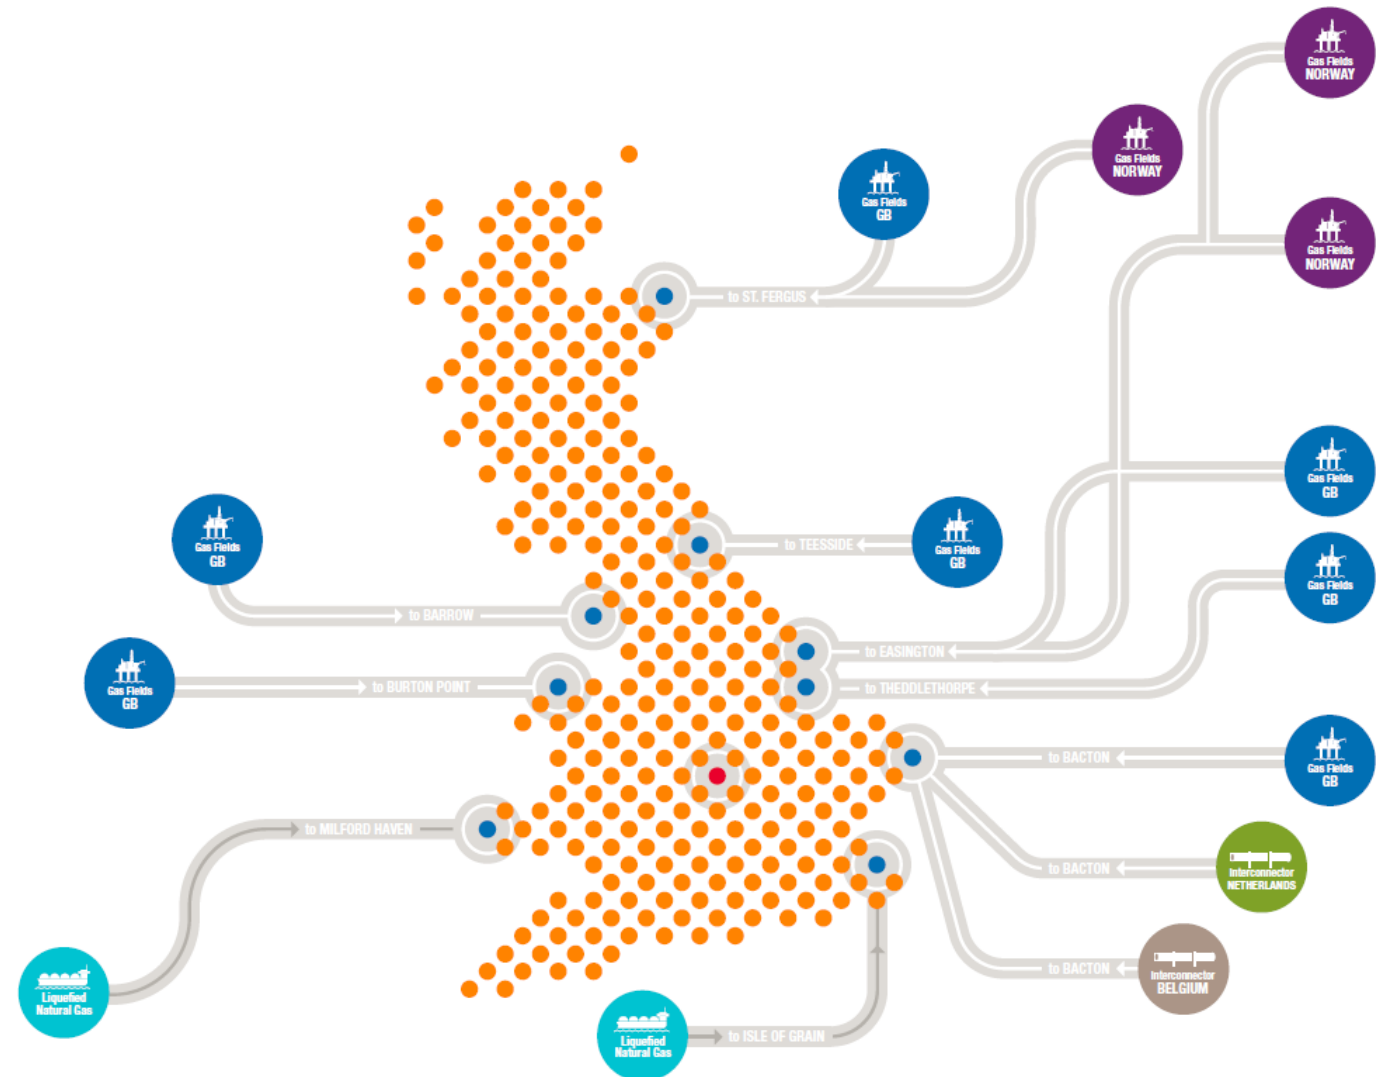

# Operating the NTS

- Natural gas comprises of **molecules** that **physically move** through the system thus is inherently different in nature to electricity
- Natural gas **moves slowly** (typically walking speed) therefore there can be a significant **lag** between a control **action** and a resultant **change** in pressure
- For this reason, the NTS requires **close active management** by the GNCC
- This is achieved through the control of physical assets, including:
  - **Compressors** which create a pressure differential in the system thus creating or **increasing** the **flow of gas** through the system
  - **Valves** which allow us to **route** gas to where it is required, **stop** gas for maintenance or capital work and isolate sections of the network in the event of an emergency
- On average we take **120 primary control actions** per day in the GNCC

# Diverse GB Supply Sources

6

10

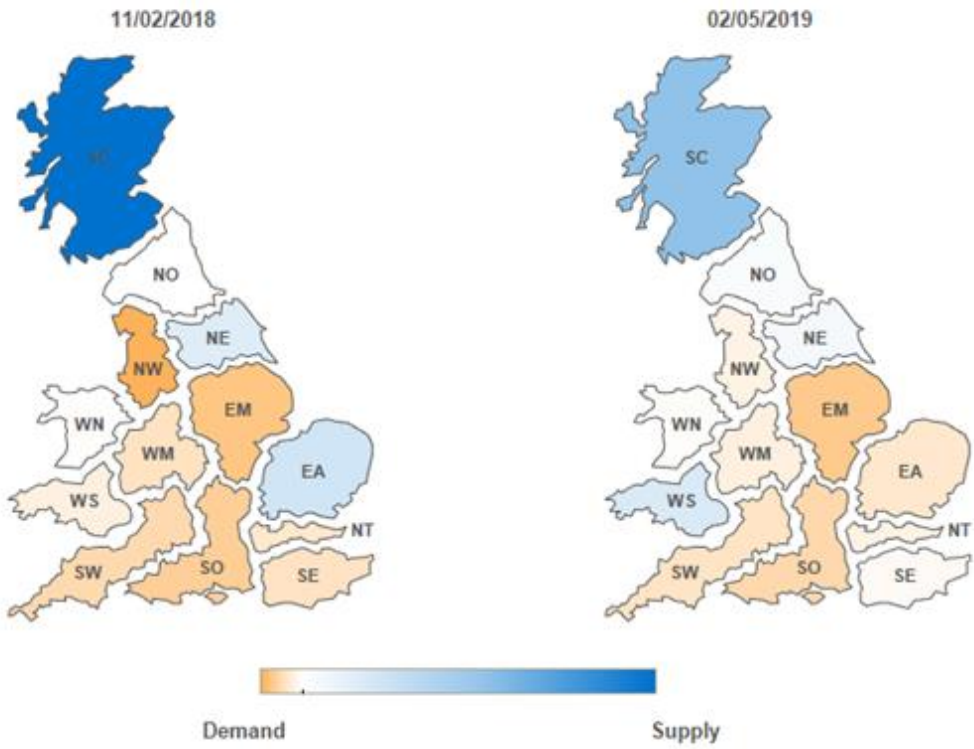

Proportion of NTS Supply & Demand by location (01/10/17 to 31/03/20)

# Moving gas around the NTS

We are **reliant** on using **compression** to move gas from the **entry points** to where it's **needed**.

Regional Supply/Demand Balance

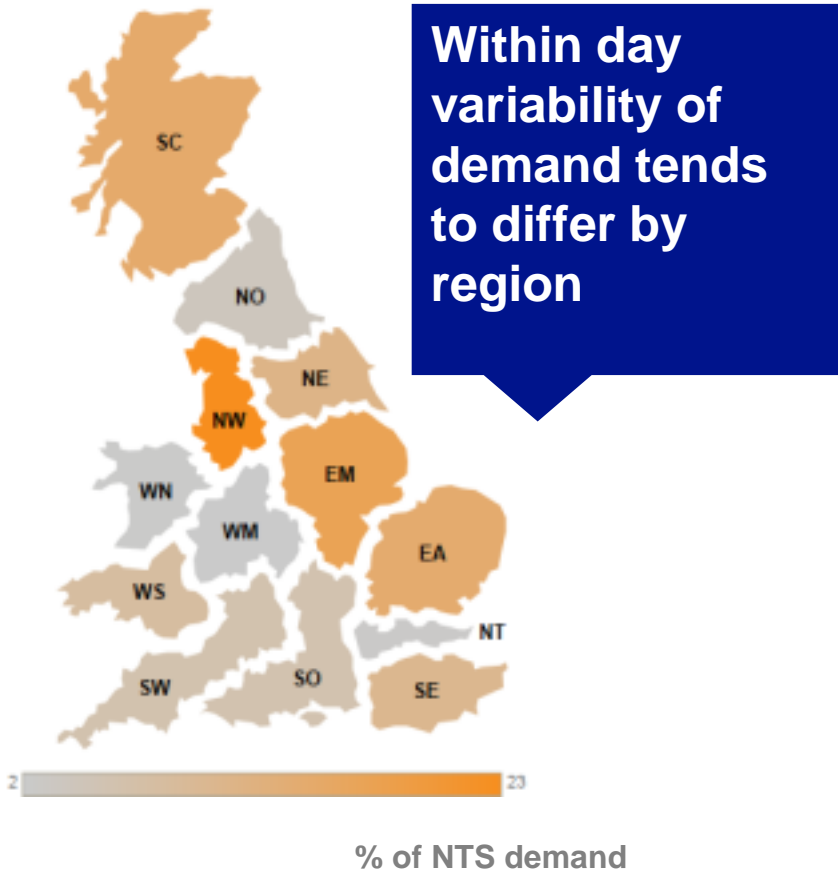

It is becoming increasingly **challenging** to plan and manage our **outage requirements without** causing customer **disruption**.

Compressor use (01/10/18 to 30/04/2020)

# .. and meeting within day supply & demand using assets

Within the day demand and supply will **vary regionally**.

National Grid

Whilst aggregate demand levels have been reducing over time, we are dealing with **more volatile demand profiles** within days.

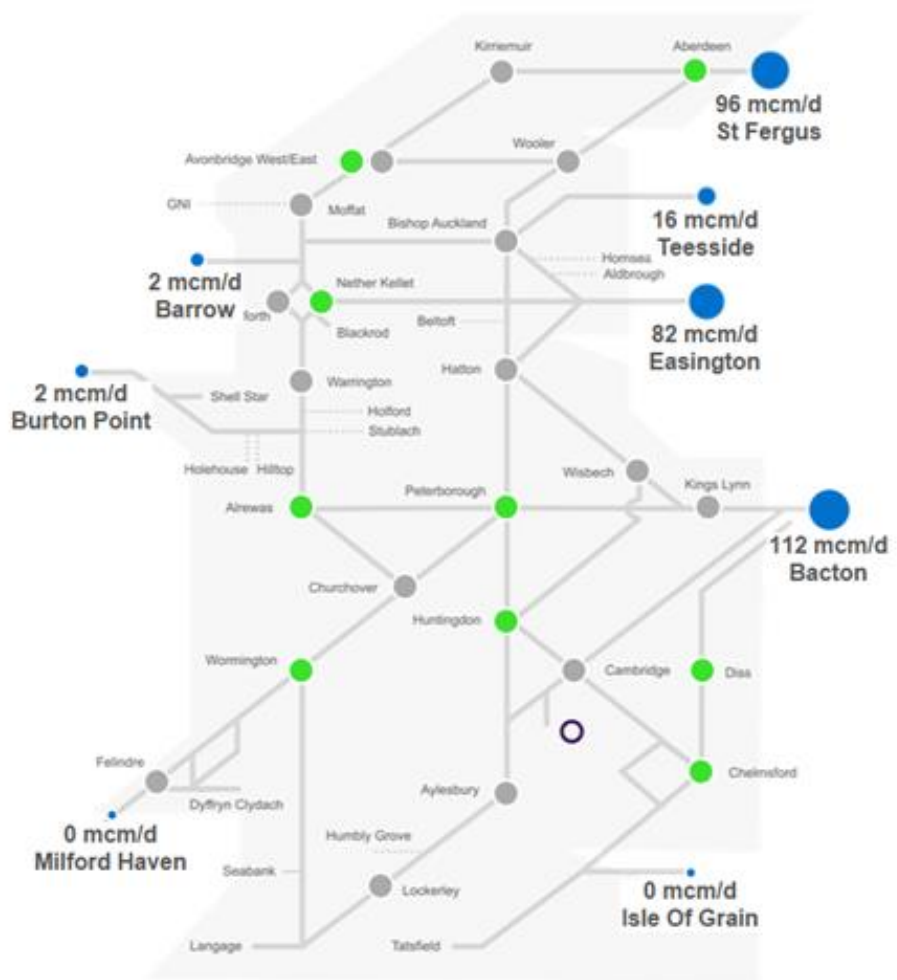

For example, the North West can vary from less than 10% to more than 20% of NTS Demand and doesn't necessarily follow a predictable pattern from day to day.

NW Demand as % of NTS Demand

# Managing Significant End of Day Supply Diversity

11/02/18 16:00  
NTS Demand 357 mcm

Similar demand patterns requiring completely **different operational configurations** over the last two years

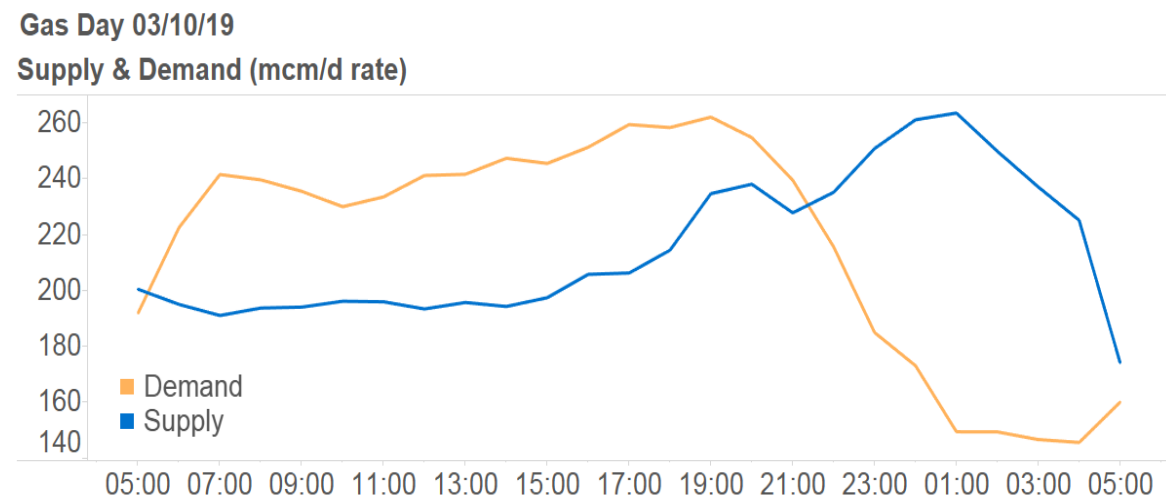

14/02/20 16:00  
NTS Demand 336mcm

18 compressors needed  
3 compressors needed  
Only 1 in common across both

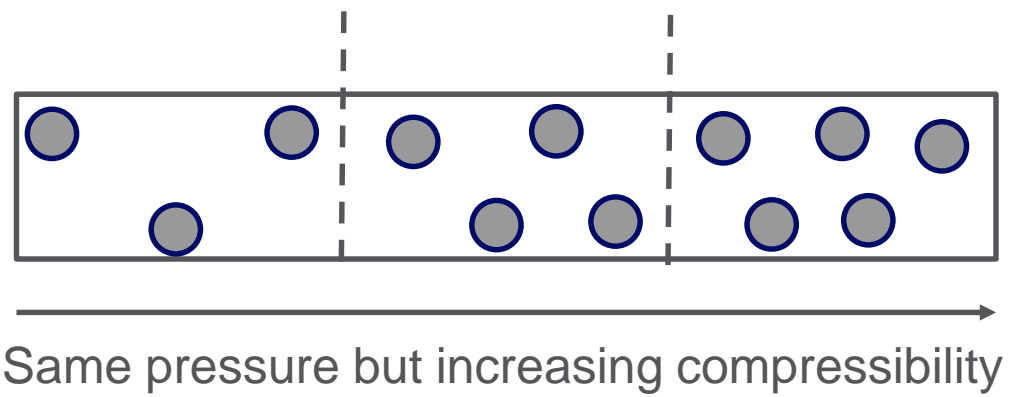

# Safe Operation of the NTS

- **Supply** and **demand** are not in steady state and **vary throughout the day**
- This **variation** affects the **volume** of gas in the system (linepack) and therefore the **pressure** within the system itself **changes**
- If **pressure** gets **too high** this could result in the safe operating limits of the physical pipelines being exceeded and the **risk of rupture**
- If **pressure** gets **too low**, it could fall below the minimum pressures required by the GDNs for them to safely run their networks, resulting in the **risk of domestic customers being disconnected**
- The **time** and **complexity** associated with isolation & **restoration** of **domestic** consumers would be **significant**
- **Gas does not fail safe**

# What is Linepack?

- Linepack describes the **total** of **volume** of **gas** contained within the system
- The methodology for calculating actual linepack is set out in our Transporters Licence and is publicly available
- Linepack considers only volume and is measured in millions of cubic meters, which is the volume the gas would cover at standard atmospheric pressure

Higher pressure and/or higher compressibility = higher linepack

More molecules in the same space

# Reliance on assets to provide market flexibility ...

- There are an increasing number of days where **market operation** is using up more of the **available linepack flexibility**
- Consequently the system is becoming **less resilient to asset failures**

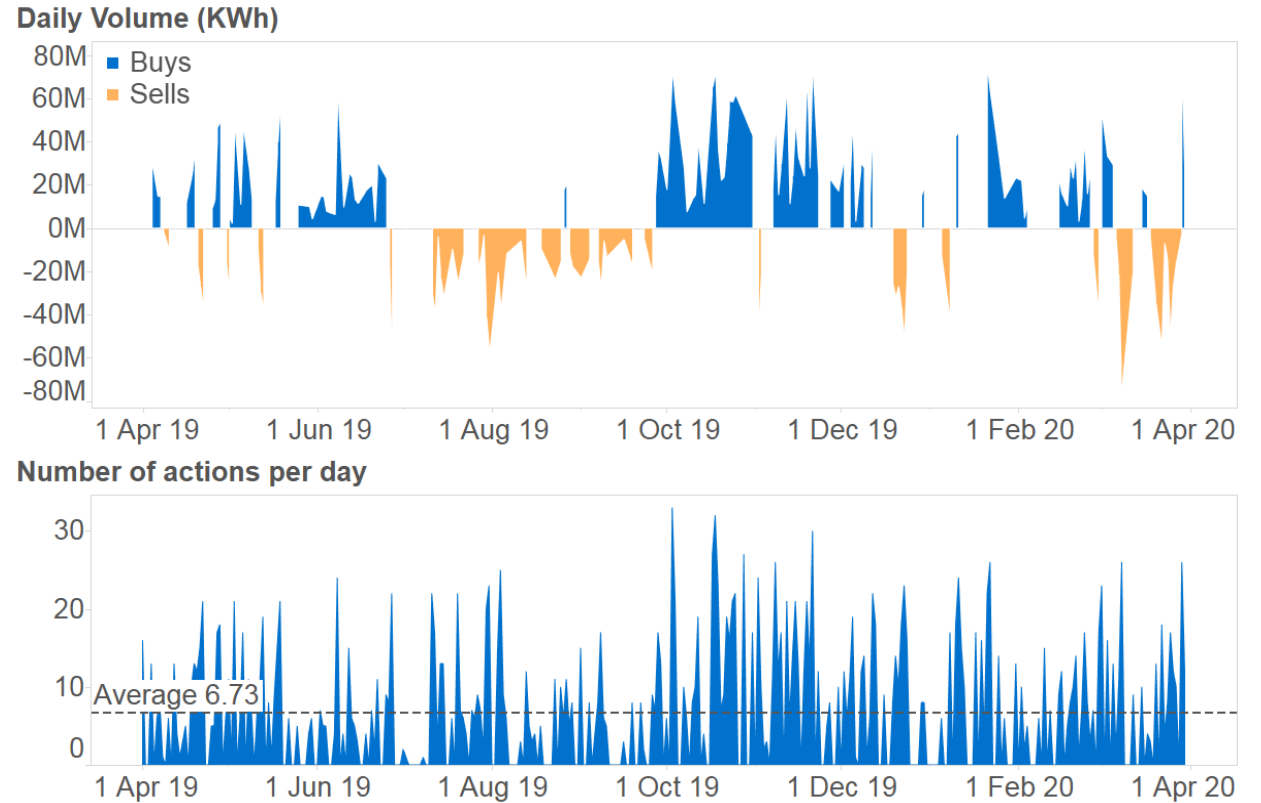

# ... with only a Residual Balancing Services Role

## GSO Total **£29M**

- Energy (OM & Balance) £28M
- Constraint £1m
- Stability Services N/A

## GSO Balancing Actions ( 1 Action = 1 OCM Title Trade)

(All figures 19/20)

# Ensuring the Balance

- Both Shippers and National Grid have established roles

## Shipper's Role in Supply

- Bring gas onto the system via UK field gas, pipeline imports, LNG (sea tanker) imports, storage exports, market trade buys
- Use supply nominations to notify us of proposed system inputs
- Incentivised to balance their inputs and outputs on a daily basis
- Entry point operators also provide us with an hourly breakdown of system inputs

## Shipper's Role in Demand

- Take gas off the system via distribution zones, industrials, power stations, pipe exports, storage imports, market trade sells
- Use demand nominations to notify us of proposed system inputs
- Incentivised to balance their inputs and outputs on a daily basis
- Exit point operators also provide us with an hourly breakdown of system outputs

## National Grid System Operator Role

- Ultimate responsibility to ensure safe operation of the grid on a daily basis (5am to 5am)
- Monitor supply/demand & transport gas for shippers whilst managing the system line pack
- Provide real time information to assist shippers with their balancing
- Enter the ICE exchange ( The On-the-day commodity market - OCM) to buy and sell title gas if shippers do not balance effectively
- Over the counter title gas is traded under the Short Term Flat NBP ( National Balancing Point) 2015 Terms & Conditions

# Ensuring the balance - Incentives are key

## DURING THE DAY

- Real time balancing information supports shipper's commercial decision making
- National Grid enters the market to balance if shippers do not balance effectively
- A penal system of imbalance pricing provides a flexible incentive for shippers to balance
- The default System Buy Price is 1.11p/therm higher and the system sell price is 1.11p/therm lower than the system average prices
- During the gas day, National Grid may trade to move these prices further away from the system average price, increasing the penalty on out of balance shippers

## AFTER THE DAY

- Shippers daily balance is calculated (gas brought on to the system minus gas taken off the system)
- The difference between these indicates a shippers imbalance
- Shippers who are “long” sell gas to NG at the System Sell Price
- Shippers who are “short” buy gas from NG at the System Buy Price
- NG is neutral to any charges or credits which is “smeared back” based on system usage

**Inputs & Buy Trades – Outputs & Sell Trades**

**= a Shippers imbalance**

**National Grid**

## SYSTEM OPERATOR INCENTIVES

The Balancing Incentive

- Driving economic and efficient balancing actions

The Line pack Incentive

- Ensuring closing the day as close to opening balance as possible

# Providing information in real-time

<http://mip-prod-web.azurewebsites.net/StatusView>

## We have recently released a new version of Prevaling View (System & Market Summary)

Further enhancements to the page will be included in future releases e.g. data ranges on charts, IT system messages

More standardised design tools used means that future changes can be made more efficiently

The screenshot shows the National Grid website interface. At the top, there is a navigation bar with links for Gas, Group, Great Britain, United States, and Ventures. Below this is a secondary navigation bar with links for Balancing, Capacity, Charging, Connections, Data and operations, Land and assets, Inflight and innovation, About us, and Contact us. The main content area features a large blue banner for "Gas Day: 01 JULY 2019" with the title "Gas System and Market Status ANS Message" and a sub-message "There are no ANS messages." Below the banner are three data cards: "TODAY: 01 JULY 2019" showing Gas Balancing Notifications as NONE and Margins Notice Trigger as 415.00 mcm; "TOMORROW: 02 JULY 2019" showing Gas Balancing Notifications as NONE, Margins Notice Trigger as 416.00 mcm, and Demand Forecast as 181.86 mcm; and an "IT Systems message" card stating "There are no IT system messages." At the bottom of the screenshot, there are two "Forecast: Short" cards, one showing -6.3 mcm and another showing -3.0 mcm, along with a "Within Day Evolution" chart for "Forecast Supply and Demand".

# Where it all happens : The Gas National Control Room

A DAY IN THE LIFE OF THE VIDEO

nationalgrid

# Part II : Impact of COVID-19 on UK Gas Demand

# Local Distribution Zone (LDZ) Demand

On a National Level, the overall **reduction** in LDZ **Demand** (compared to expected demand based on CWV) was **9%** to begin with

This was due predominantly to **embedded Industrial** and **Power station** reductions, and the impact has periodically reduced over time as Industry has ramped up

# Covid-19 Demand Impact

Impact to date has largely been on **Industrial** and **Power station demand**

Currently there is **no clear impact** on **domestic demand**

- Relatively **mild weather** still so would not expect to see an impact yet
- Demand actuals, within day profiles and UIG will help to understand domestic use as temperatures drop

DN Offtake Flows vs CWV (17 Feb – 16 October)

**Has this overview been helpful?**

**Yes**

**Somewhat**

**No**

Please explain your answer

**What else would you like to see?**
